Ch. 9

Ray Optics   Formula Sheet

1. Reflection of Light by Spherical Mirrors

(i) $\angle i = \angle r$ [Law of reflection]

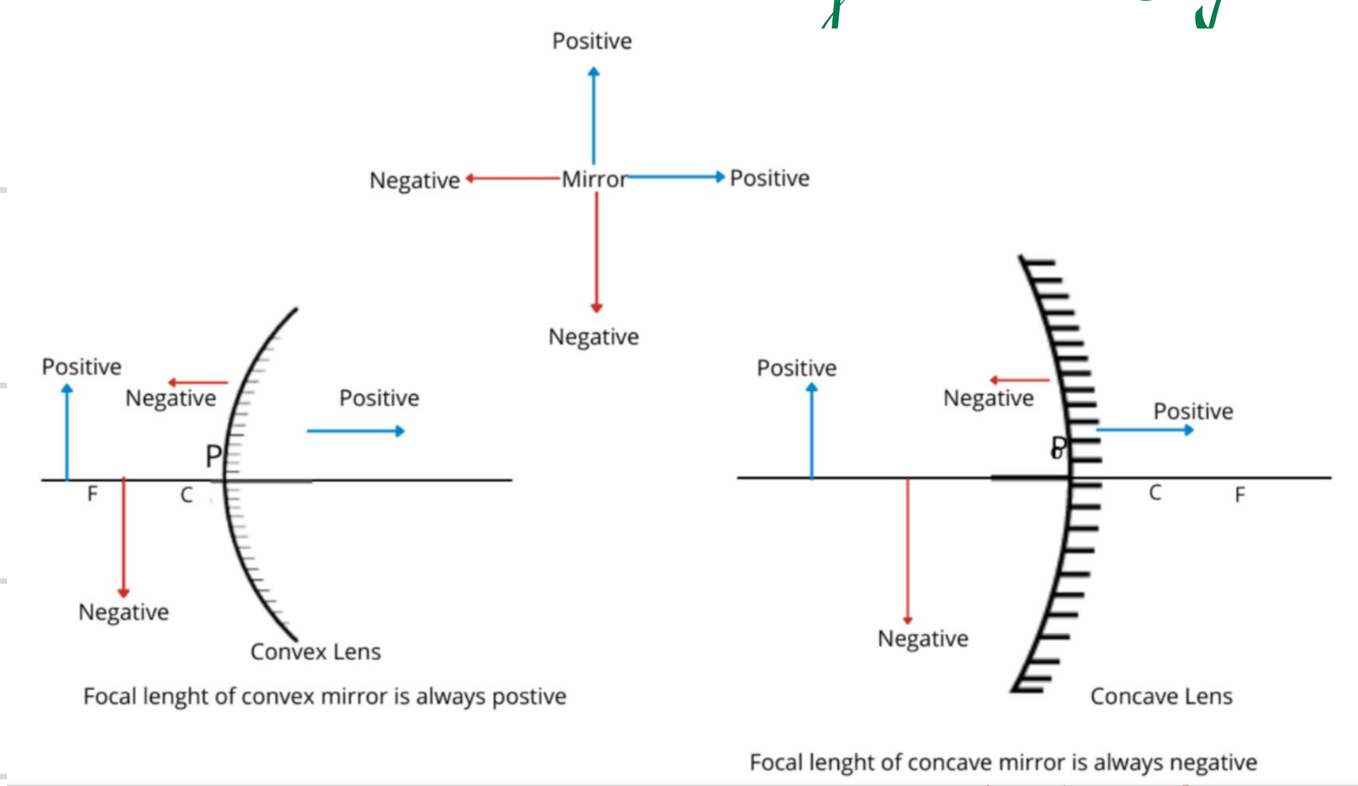
(ii) $f = \frac{R}{2}$ $f \rightarrow$ focal length
$R \rightarrow$ Radius of curvature

(iii) $\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$ [Mirror formula] → For both type of mirrors

$f \rightarrow$ focal length of mirror [+ve for convex mirror, −ve for concave mirror]
$v \rightarrow$ Image distance from mirror
$u \rightarrow$ Object distance from mirror

Sign of u and v are taken according to sign convention.

(Left of mirror −ve, Right of mirror +ve)



(iv) Magnification

$$m = \frac{I}{O} = \frac{-v}{u} = \frac{f-v}{f} = \frac{f}{f-u}$$

$I \rightarrow$ height of image, $O \rightarrow$ height of object

@jyotisharmaphysics

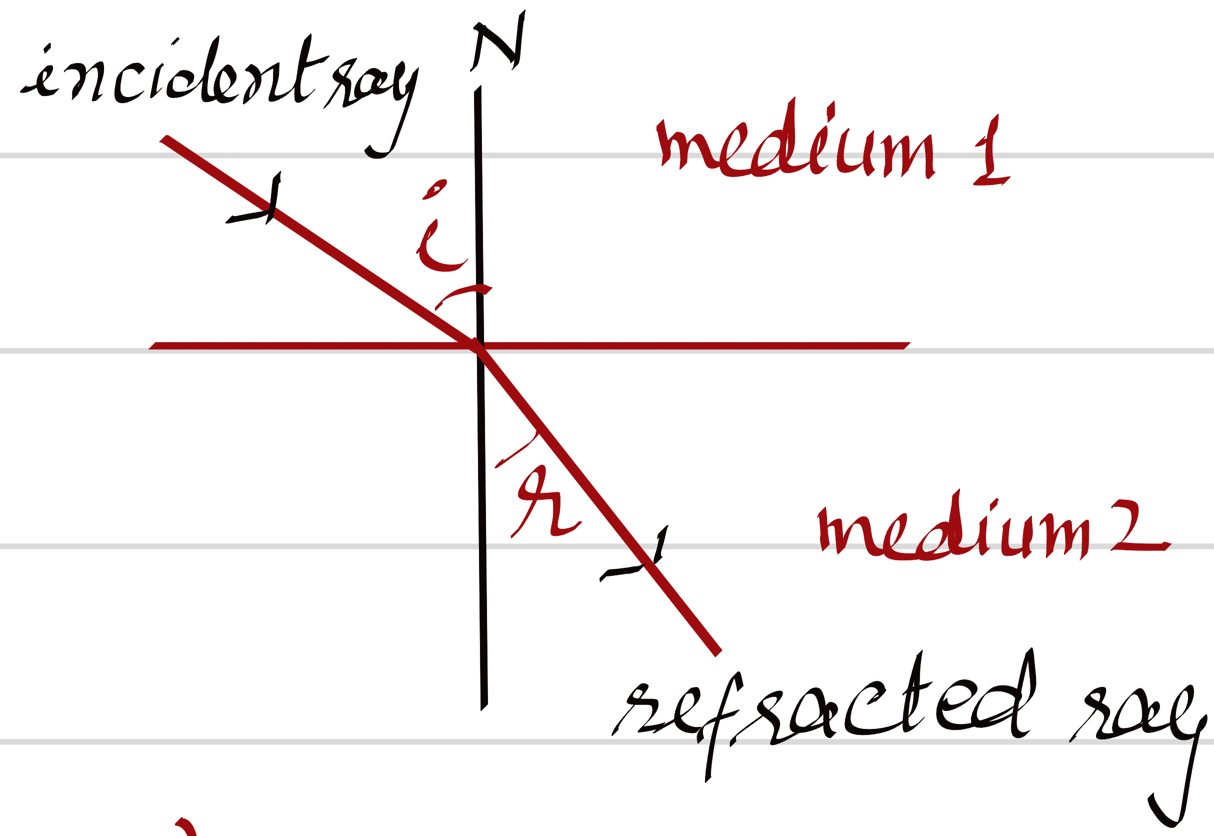
m is +ve for virtual and erect image
m is −ve for real and inverted image

2. Refraction of light (Light goes one medium to another medium)

(i) Snell's law $n_{21} = \frac{\sin i}{\sin r} = \frac{n_2}{n_1}$

$n_{21} = {}_1n_2 = \frac{n_2}{n_1}$

$n_{21} \rightarrow$ Refractive index of medium 2 with respect to medium 1.



(ii) If light travels from vacuum / air to any other medium then

Refractive index (n or μ)

$$n_{21} = \frac{n_2}{n_1} = \frac{v_1}{v_2} = \frac{c}{v}$$

$c = 3 \times 10^8$ m/s

$c \rightarrow$ speed of light in space/vacuum/air

$v \rightarrow$ speed of light in any medium

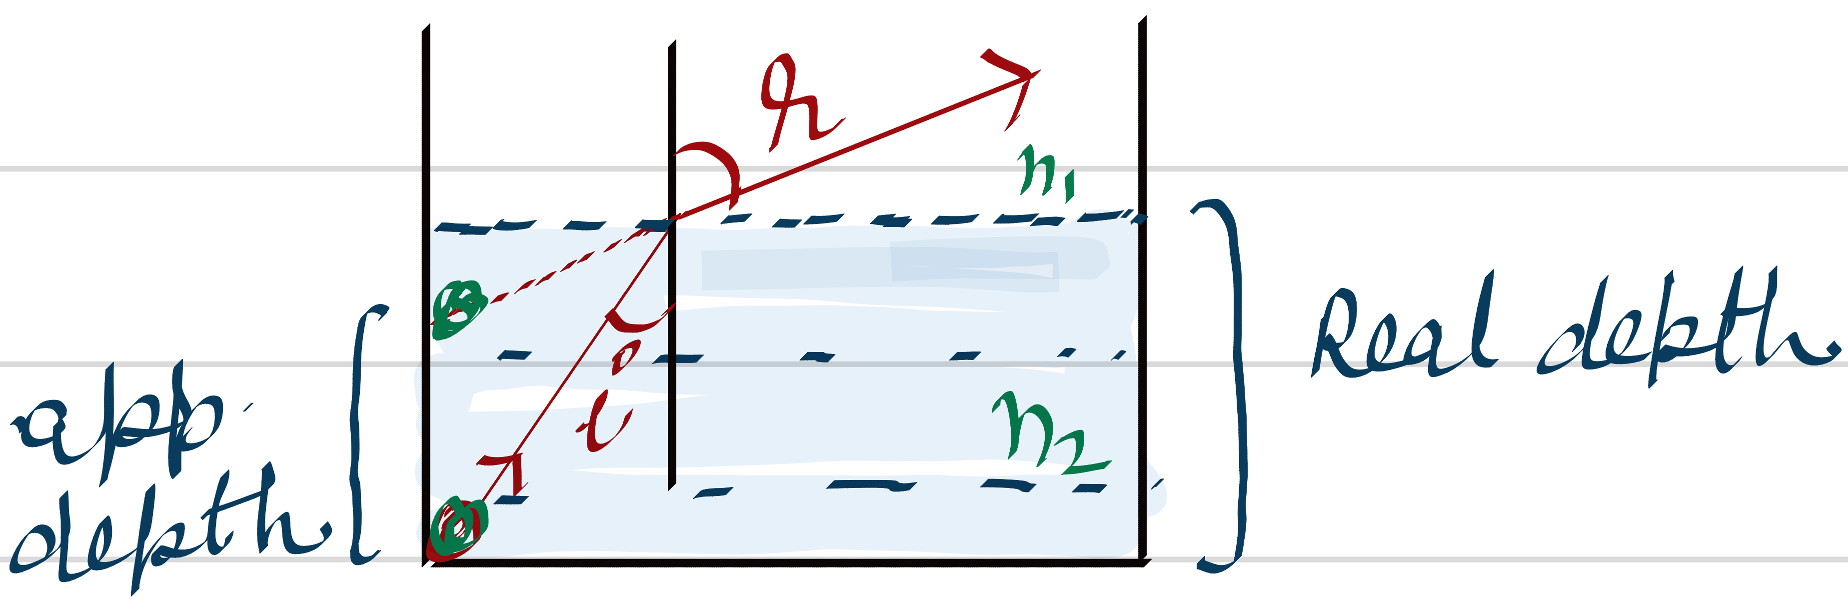
also,

$$n_{12} = \frac{n_1}{n_2} = \frac{v_2}{v_1}$$

$n_{12} \rightarrow$ Refractive index of medium 1 w.r. to medium 2.

3. Relation b/w Real depth and Apparent depth

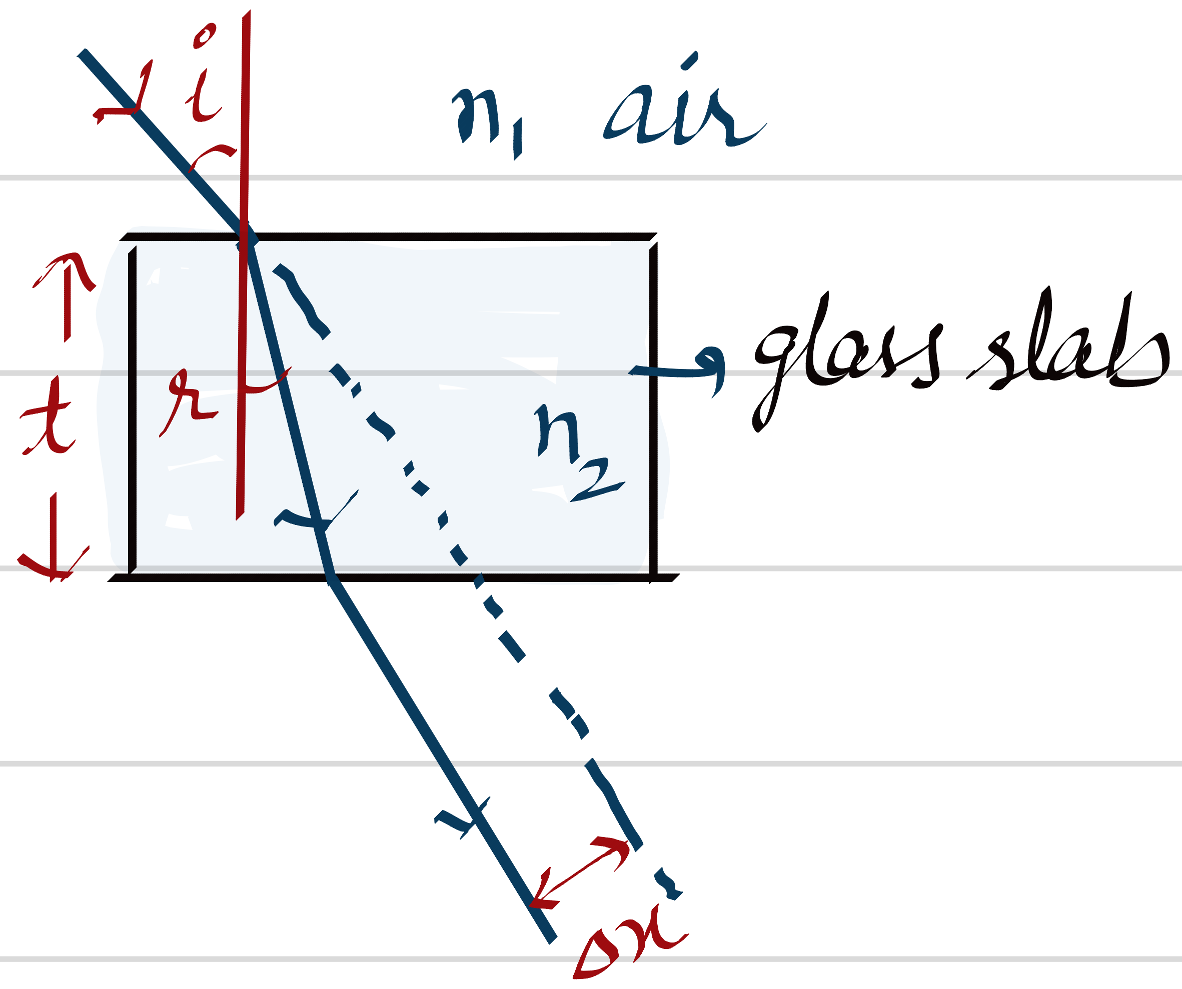
$$n_{21} = \frac{\text{Real depth}}{\text{Apparent depth}} = \frac{h_{Real}}{h_{apparent}}$$



@jyotisharmaphysics

4. Lateral Shift

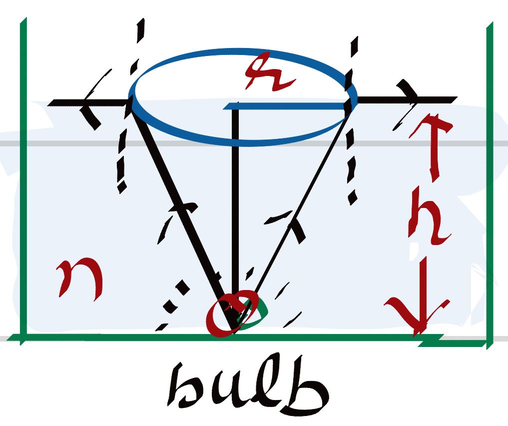
$$\Delta x = \frac{t \sin(i - r)}{\cos r}$$



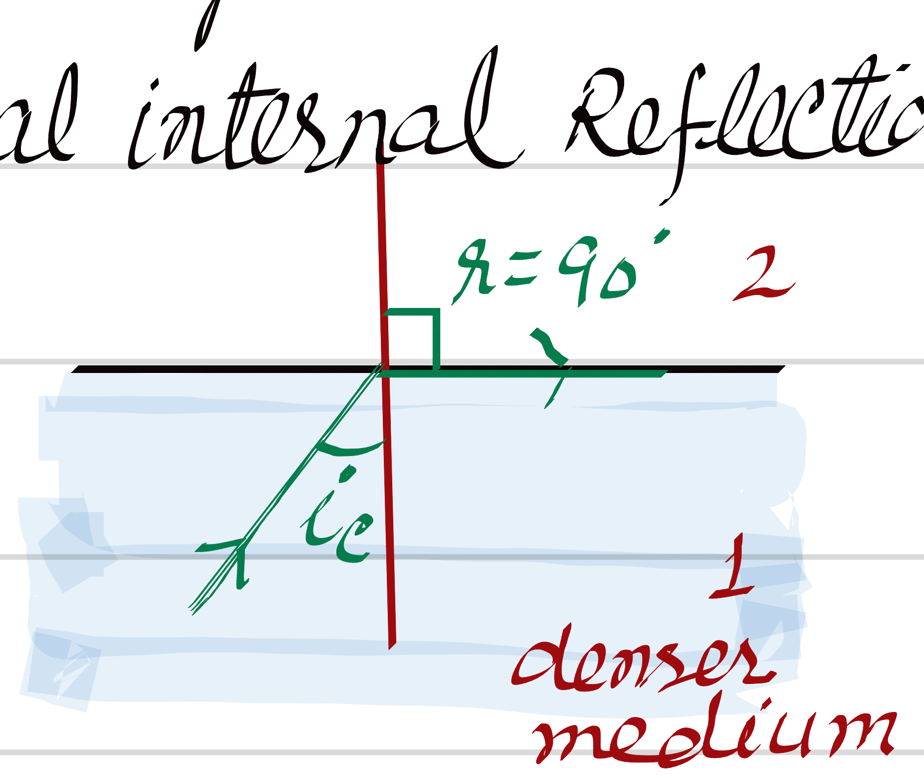
5. Relation between critical angle (i_c) refractive index (n) [Total internal Reflection]

radius of circular area of light

$$r = \frac{h \text{ (height)}}{\sqrt{n^2 - 1}}$$



$$n_{denser} = n_{12} = \frac{1}{\sin i_c}$$

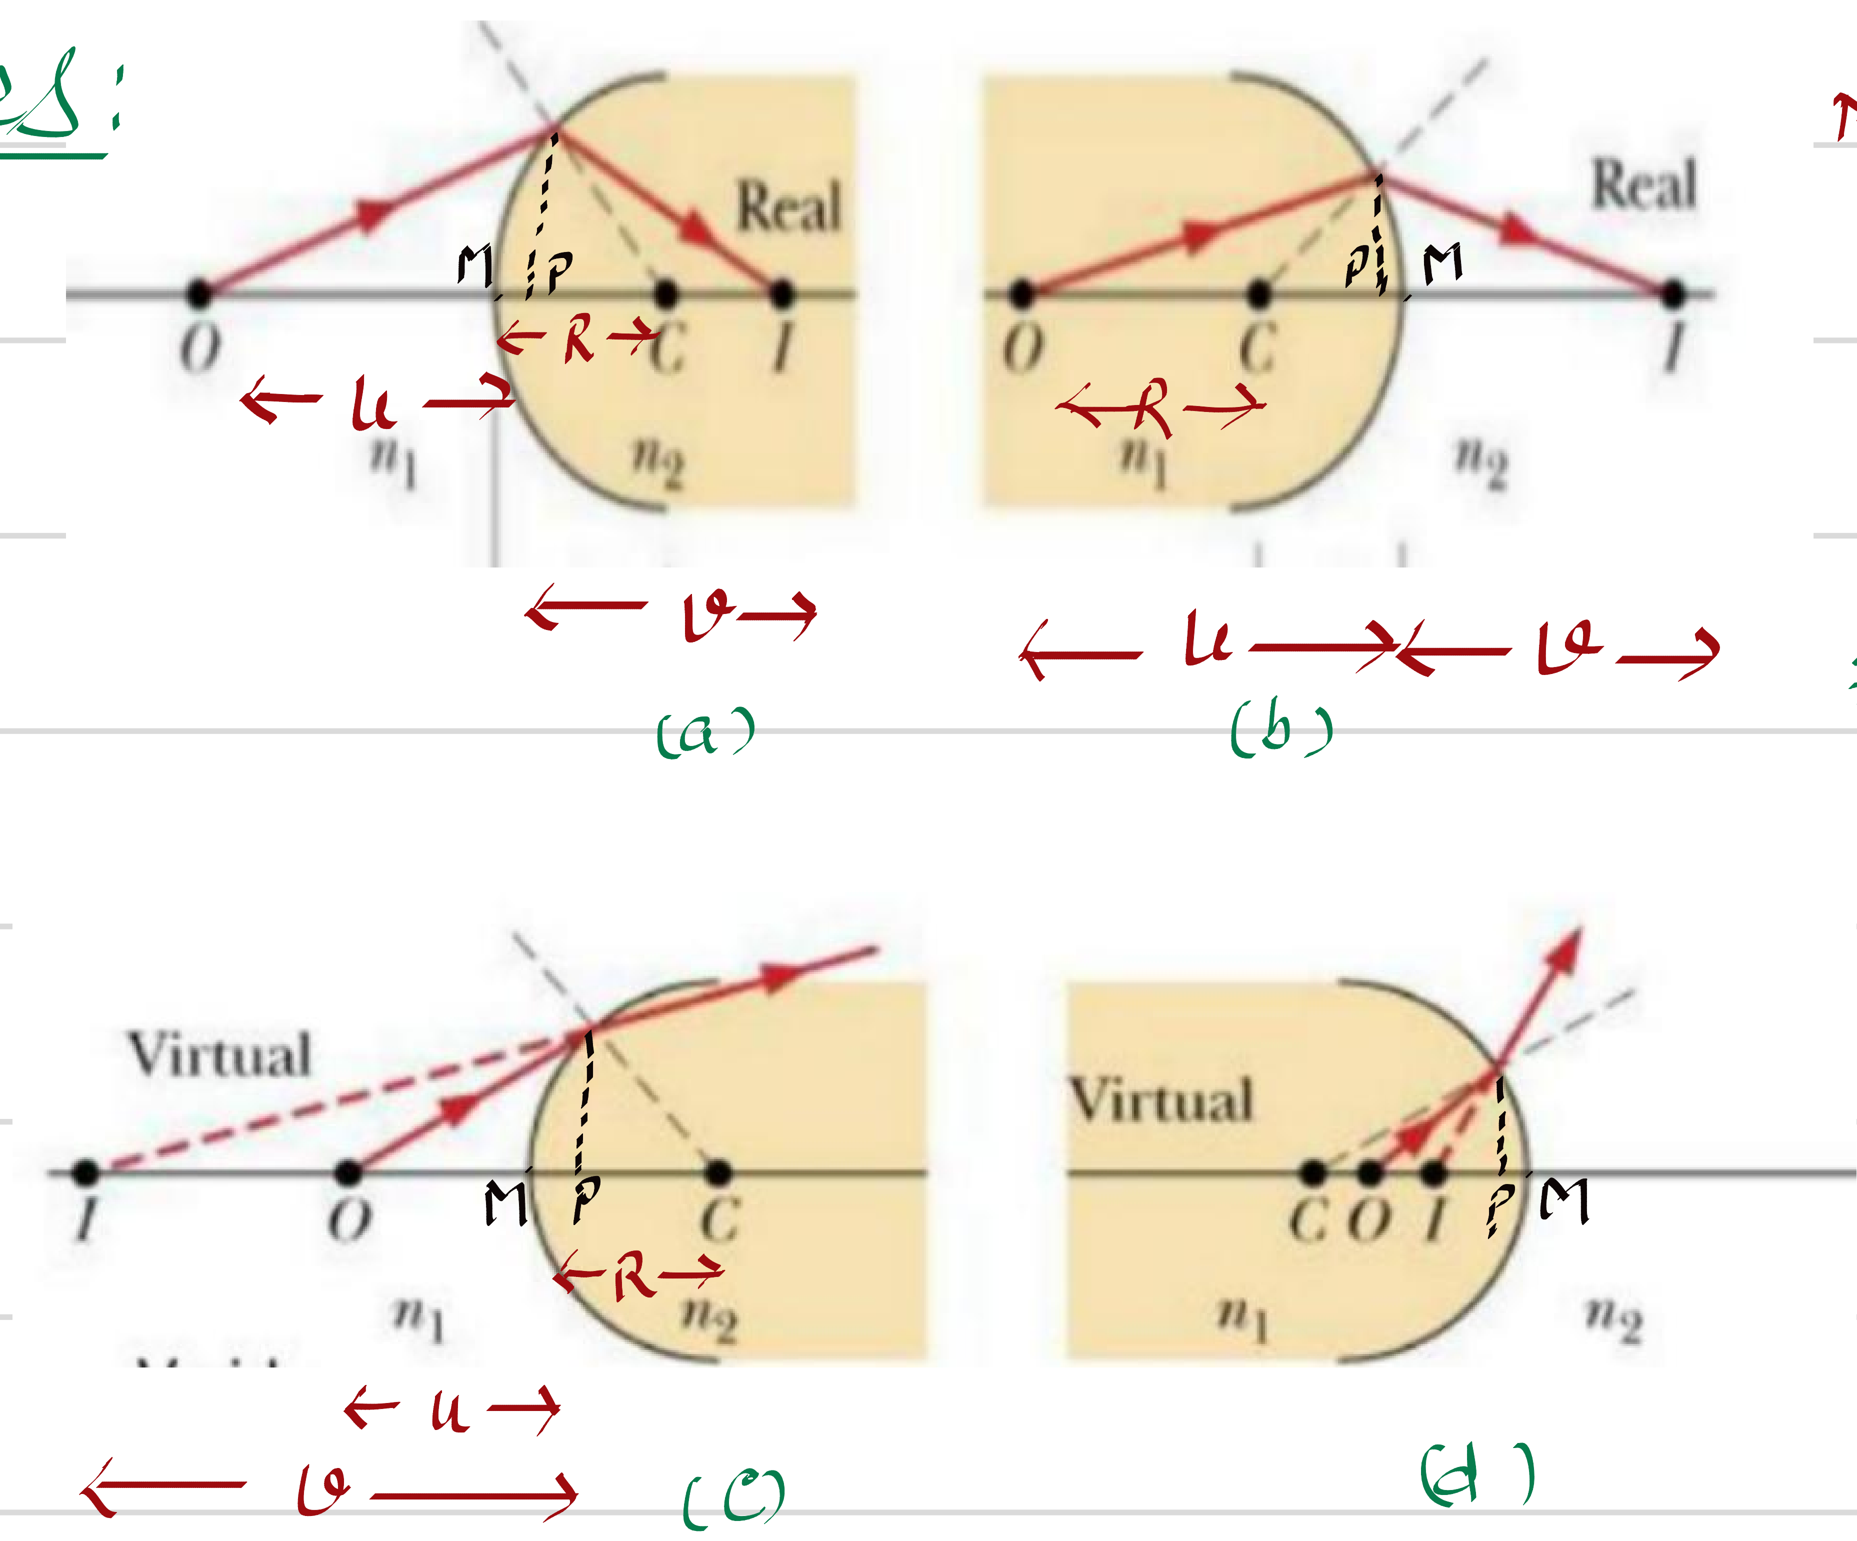


* higher the R.I of denser medium, smaller the critical angle.

6. Refraction at spherical surface

$$\frac{n_2}{v} - \frac{n_1}{u} = \frac{n_2 - n_1}{R}$$

Six Cases:



M and P are very close

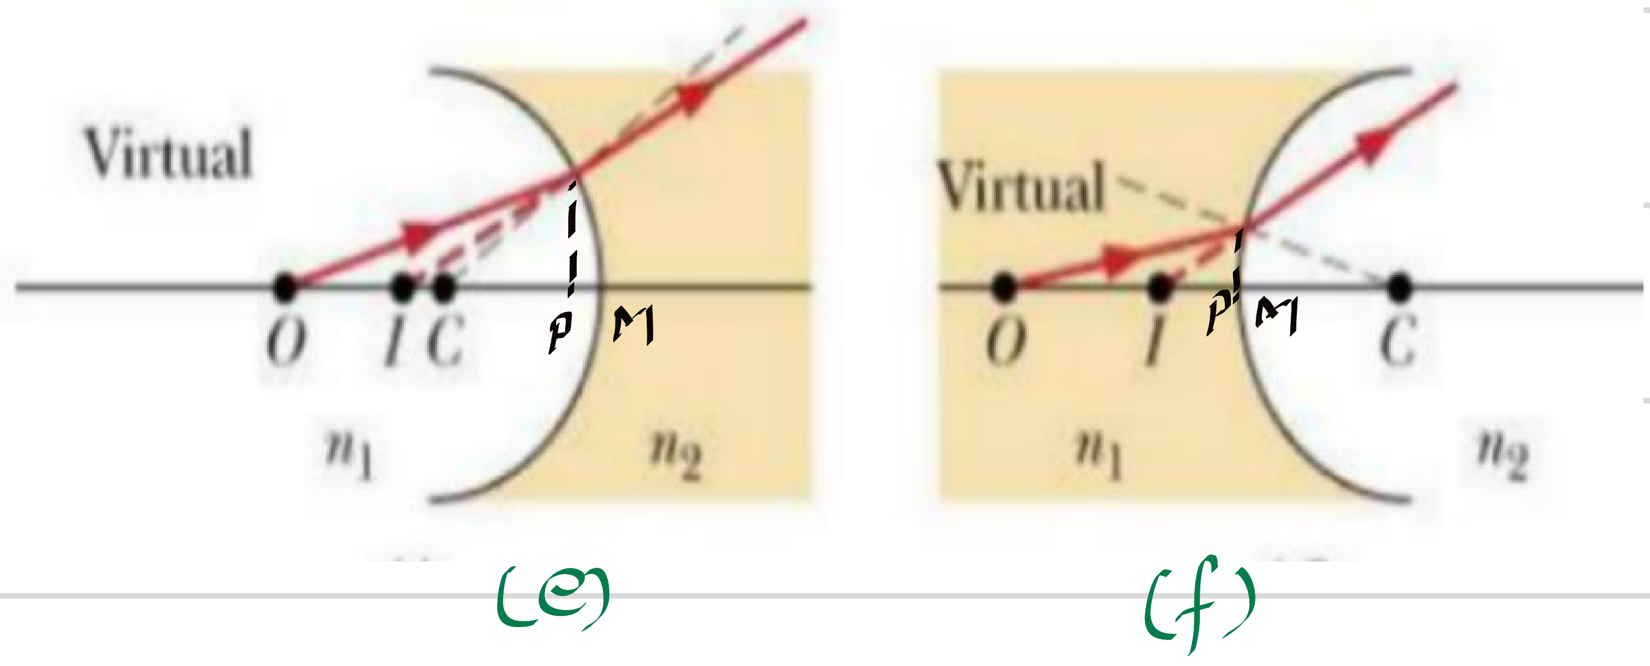
MO ≈ PO = u

MC ≈ PC = R

MI ≈ PI = v

*(Sign of u, v and R are taken by sign convention)

*[−ve for left of M
+ve for right of M]



7. Lens formula (For both lenses - Concave & convex)

$$\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$$

$f \rightarrow$ focal length
$v \rightarrow$ image distance
$u \rightarrow$ object distance

(Sign of u and v are taken according to sign convention. Focal length f → +ve for convex, → -ve for concave)

8. Lens maker's formula

$$\frac{1}{f} = (n_{21}-1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

$$\frac{1}{f} = \left(\frac{n_2}{n_1} - 1\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

$n_1 \rightarrow$ R.I of medium
$n_2 \rightarrow$ R.I of lens

(Sign of R_1 and R_2 are taken according to sign convention)

* If $n_1 > n_2$, behaviour of lens changes. i.e concave lens behaves as convex and vice-versa.

9. Magnification of lenses

$$m = \frac{I}{O} = \frac{v}{u}$$

$I \rightarrow$ height of image

$O \rightarrow$ height of object

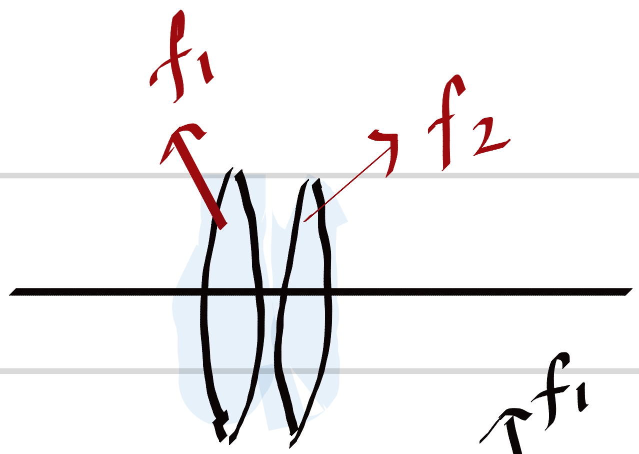
m is +ve for virtual and erect image

m is -ve for real and inverted image

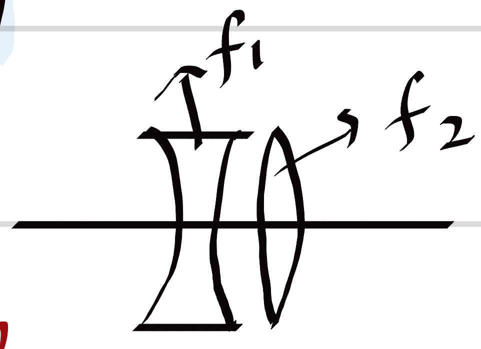
10. Power of lens

$$P = \frac{1}{f(m)} = \frac{100}{f(cm)}$$

SI unit of P is Dioptre (D)



11. Combination of lenses



(i) For focal length of combination

$$\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2}$$ [for two lenses]

[* Focal lengths are taken with sign]

$$\frac{1}{f} = \frac{1}{f_1} + \frac{1}{f_2} + \cdots \frac{1}{f_n}$$ [for n lenses]

(ii) For power of combination

$$P = P_1 + P_2$$ [For two lenses]

$$P = P_1 + P_2 + \cdots P_n$$ [For n lenses]

(iii) For magnification

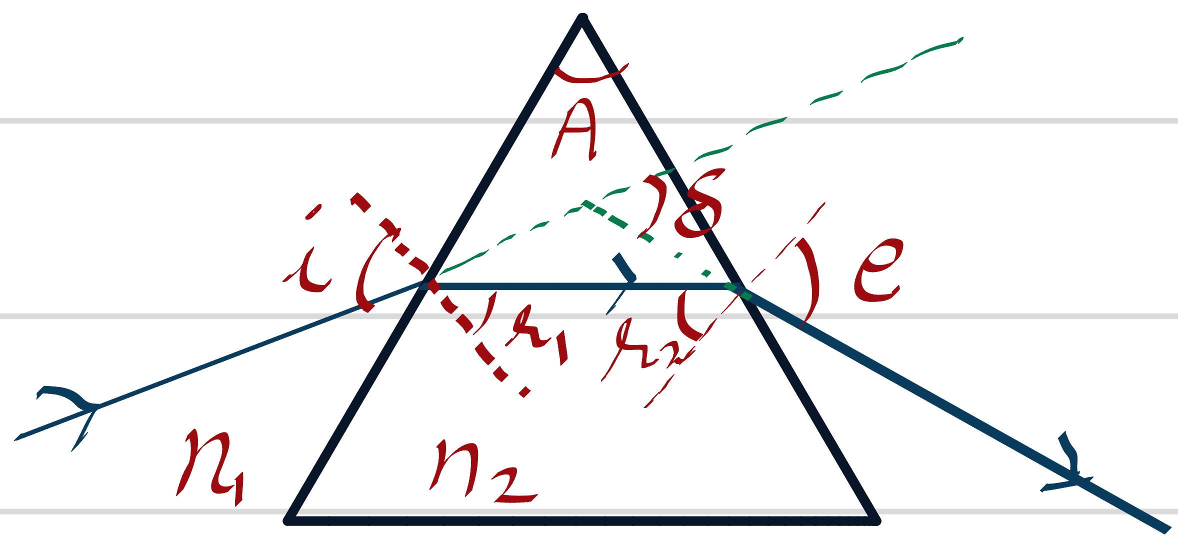
$$m = m_1 m_2 \cdots$$

* Magnifications are multiplied

12. Dispersion of light by Prism

(1) Angle of deviation δ

$$\delta = i + e - A$$



For minimum angle of deviation

$$\delta_m = 2i - A \quad [\because i = e]$$

A → Prism angle
i → incident angle
e → emergent angle
δ → angle of deviation

Refractive index of prism

$$n_{21} = \frac{\sin\left(\frac{A+\delta_m}{2}\right)}{\sin\frac{A}{2}}$$

[n_{21} → R.I of prism meterial]

For thin prism,

$$\delta_m = (n_{21} - 1)A$$

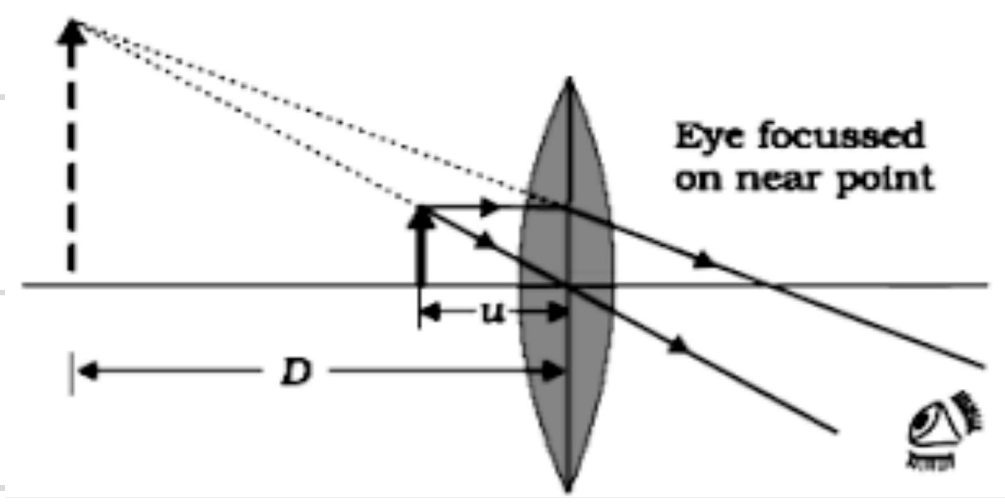
13. Magnifying Power of Microscope

(1) Simple Microscope

(i) Final image at D

$$m = 1 + \frac{D}{f}$$

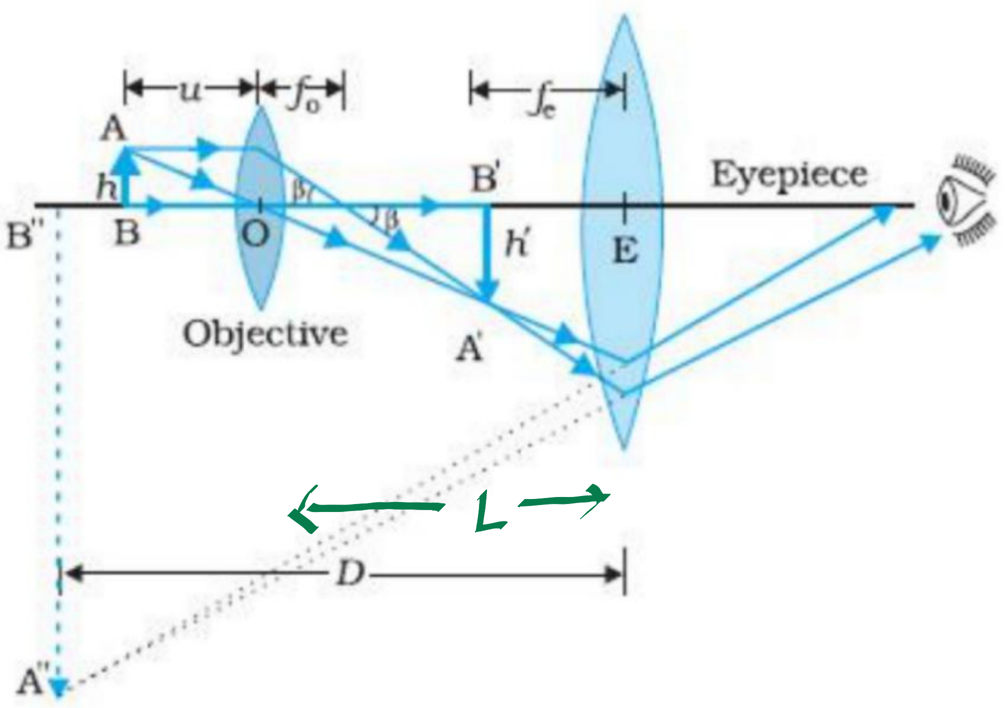
D → Least distance of distinct vision = 25cm (near point)



(ii) Final image at ∞

$$m = \frac{D}{f}$$

(II) Compound Microscope



(i) Final image at D

$$m = \frac{v_o}{-u_o}\left(1+\frac{D}{f_e}\right)$$

$$= \frac{-L}{f_o}\left(1+\frac{D}{f_e}\right)$$

[Since image is formed very close to eyepiece $u_o \approx f_o$ and $v_o \approx L$]

(ii) Final image at ∞ [Normal adjustment]

$$m = \frac{-L}{f_o} \cdot \frac{D}{f_e}$$

14. Magnifying Power of Telescope

(i) Final image at D [near point adjustment]

$$m = -\frac{f_o}{f_e}\left(1+\frac{f_e}{D}\right)$$

$\left[\because m = -\frac{f_o}{u_e}, \frac{1}{u_e} = \frac{1}{f_e} + \frac{1}{D}\right]$

@jyotisharmaphysics

(ii) Final image at ∞ [normal adjustment]

$$m = -\frac{f_o}{f_e}$$

Tube length $L = f_o + f_e$
